AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                     Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nicotiana tabacum; tobacco plant; osmotin gene; promoter; inhibition; fungal pathogen; insect pathogen; nematode pathogen; viral pathogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  71.4%; Score 35; DB 20; Length 189; 100.0%; Pred. (I) has cytostatic, immunomodulatory, haemostatic, anti-HIV and antiinflammatory estivities. (I) and the polynucleotide encoding it are applicable in the diagnosis and treatment of malignant neoplasm, haemopathy, HIV infection, immunological diseases and various inflammations.
amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; myelin PO protein 14; cytostatic; immunomodulatory; haemostatic; anti-HIV; antiinflammatory; diagnosis; malignant neoplasm; haemopathy; HIV infection; immunological disease; inflammation.
                                                                                                                                                                                        Gaps

The method comprises: (a) providing or constructing a vector comprising an osmotin promoter and foreign DNA sequence encoding a pathogen-inhibiting protein, where the promoter is operably linked to the foreign DNA sequence and includes: (i) nuclectide sequence 5 of the osmotin coding sequence and includes: (i) nuclectide sequence 6 for the osmotin coding sequence, the coding sequence faithed as tarting at bp 2034 of the 3033 bp osmotin sequence (see AAV52754), (ii) a nuclectide sequence which hybridises to (i) and promotes expression of an operably introducing the vector into the plant to create a transformed plant, where expression of the pathogen-inhibiting protein in the transformed plant is regulated by the osmotin promoter. The method is useful for the plant is regulated by the osmotin promoter. The method is useful for the production of recombinant plants having genes under control of an osmotin promoter, especially of pathogen inhibiting proteins. Osmotins are cationic plant proteins, similar to tobacco PR-5-type proteins. The osmotin genes are under control of hormonal or environmental signals, including abscisic acid, ethylene, tobacco mosalc virus invention, callintly, desiccation and wounding. The present sequence represents the Nicotiana tabacum osmotin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                            Inhibition of pathogens in plants by recombinant expression of pathogen inhibiting proteins - uses nucleic acid constructs containing the pathogen inhibiting proteins under control of osmotin promoter, which is inducible by specific signals

The present sequence represents the Nicotiana tabacum (tobacco) osmotin protein. The present invention specifically claims a DNA fragment comprising the osmotin gene promoter sequence with no more than 100 bp of the coding sequence. Also described are methods which are useful in processes for achieving expression of a coding sequence from a foreign
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                            polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical magning of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                and to produce other types of data and products dependent on DNA and mainto acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated polynucleotide encoding a polypeptide involved in cell signaling used for generating transgenic plants with modified responses to external signals ^{\circ}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eucalyptus grandis; Pinus radiata; Monterey pine; plant; modification; plant cell signaling; modulation; transgenic plant; pathogen; growth; environmental change; development; cell proliferation; differentiation; elongation; survival; disease resistance; nutrient metabolism.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Eucalyptus grandis cell signalling involved protein SEQ ID NO:802.
                                                                                                                                                                                                                                                                                                                                                                                                    ;

AAA79263 to AAA79736 and AAB25100 to AAB25570 represent polynucleotide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Pinus radiate also known as Monteey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external cevelopment of a plant. They can be used to modify cell proliferation, differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance altered fruit rad be used to delay senescence in selected cell types or cogans providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

                                                                                                                                                                                                                                                                                        ö
                       Nucleic acid encoding human p300 that associates with adenovirus ElA. - and related vectors, host cells and screening assays, also diagnosis of cancerous and pre:cancerous tissue by detection of
                                                                                                               Transcription factor p300 was isolated from human 293 cells and used to generate polyclonal antisera in mice. These were used to screen 293 cDNA libraries to isolate clones contg. overlapping inserts, which were assembled to obtain a full-length cDNA sequence (AAT02792) encoding a protein (AAR84882) of predicted mol.wt. 264.236 kDa. p300 may be produced in host cells (pref. mammalian) and used to modulate p300-dependent transcription.
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide sequence comprises p300, a global transcriptional coactivator that is involved in the regulation of various DNA-binding transcriptional factors. The invention relates to a

CC modulates transcription through binding to p300 and CDPC (See AMW40058). The region (see AWW40055) of p300 that binds to P/CAF (See AWW40058). The region (see AWW40055) of p300 that binds to P/CAF (See AWW40058). The region (see AWW40055) of p300 that binds to P/CAF (See AWW40058). The region (see AWW40055) of p300 that binds to P/CAF (See AWW40058). The invention provides methods of screening for compounds that inhbit or stimulate the transcription modulating CC and histone acetyltransferase activity of P/CAF and p300/CBP. CC Inhibitors can be used e.g. to inhibit HIV TAT-mediated concer or to activate tumour suppressor p53 in the treatment of CC cancer or to activate the muscle differentiation. The products can also be used to promote muscle differentiation. The products can also be used to concerting the sample brinds p300/CBP in a subject. Also provided is concerting the sample with the P/CAF binding region of p300 and CC determining the amount of P/CAF in a sample by CC determining the amount of P/CAF in a sample by CC determining the amount of P/CAF binding region of p300 and XX Sequence 2414 AA;

Title-directed mutagenesis of cysteine residues in biliverdin
"Site-directed mutagenesis of cysteine residues in biliverdin
"Site-directed mutagenesis of cysteine residues in biliverdin
reductase. Roles in substrate and cofactor binding.";

Eur. J. Biochem. 222:597-603(1994).

-!- FUNCTION: CONVERTS BILIVERRIN TO BILIRUBIN: DISPLAYS TWO DISTINCT
PH OPTIMA USING A DIFFERENT COFACTOR AT EACH PH: NADH AT THE LOWER
PH 6.77-6.9 RANGE AND NADH AT PH 8:5-8.7. NADPH, HOWEVER, IS THE
PROBABLE COFACTOR IN BIOLOGICAL SYSTEMS.

-!- CATALYTIC ACTIVITY: BILILIRUBIN + NAD(P)(+) = biliverdin + NAD(P)H.

-!- PATHWAY: FINAL STEP IN HEME METABOLISM.

-!- PATHWAY: FINAL STEP IN HEME METABOLISM.

-!- SUBUNITY: MONOMER (BY SIMILARITY).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
